

A Comparison of energy consumption of Cars, Transit Buses Rail and air.

Based of data found in:

The transportation Energy Data Book: Edition 25 - 2006 .

a publication prepared for the U.S. department of energy
by the Oak Ridge National Laboratory

Energy consumption of car-bus-air compared

Table 2.10 lists energy consumption of various modes of passenger travel. It shows that cars use less energy than rail, transit bus or commercial air. Here are the numbers from table 2.10 and from below:

mode	btu/passenger mile
Car, hybrid	1,326 (Honda Insight-see below)
Van Pool	1,401 (National average)
Car, efficient	2,488 (2006 KIA Rio-see below)
Commuter rail	2,751
Amtrak	2,935 Amtrak
Light & heavy rail transit	3,228 Light rail & heavy rail transit
Car, average	3,549 (National average)
TriMet bus	3,792 (Data directly from TriMet)
Commercial air	3,587 (see note in link)
Transit bus	4,160 (National average)

The car number is an average based on the average current fleet and an average number of passengers. More efficient cars are readily available, for instance the \$10,770, 2006 KIA Rio is listed at 32 MPG city. This is 3906 btu/vehicle-mile, or 2488 btu per passenger-mile using 1.57 passengers per vehicle, only 60% as much energy as a transit bus.

For Portland where we drive alone more, the passengers per vehicle is about 1.3, so the following apply: With an average of 1.3 passengers, the 2006 KIA Rio becomes 3004 btu per passenger mile which is 26% less energy than Trimet busses per passenger mile. The Honda Insight at 60 MPG city is 2083 btu per vehicle mile (1602 per passenger-mile@1.3passengers), uses less than one-half the energy of a Trimet bus. At two passengers it consumes only 1042 btu per passenger mile - less than 1/3 that of a Trimet bus.

Do high density cities have lower transit energy consumption than the average?

No. See Figure 2.2.

Why do people think that transit buses save energy?

Because they did in 1970, but over the years, buses became less efficient and cars more efficient. See table 2.11

What about using Europe as a model, they all take transit don't they?

Figure 3.1 shows vehicles per 1000 people from 1940 to present. It also shows European vehicles per 1000 at two points in time, 1994 and 2004. Viewing the chart, the U.S. has about 750 vehicles per 1000 people while Europe has about 560, or about 75% as many. Interestingly, Europeans have about 75% as much income as we do. They also pay a lot more for fuel.

Conclusion

The most practical way to reduce transport energy consumption is to encourage people to switch to small cars. It will save more energy than transit and is more likely to succeed.

Great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages, and there is a great deal of variability even within a mode.

Table 2.10
Passenger Travel and Energy Use, 2003

	Number of vehicles (thousands)	Vehicle-miles (millions)	Passenger-miles (millions)	Load factor (persons/vehicle)	Energy intensities		Energy use (trillion Btu)
					(Btu per vehicle-mile)	(Btu per passenger-mile)	
Cars	135,669.9	1,660,828	2,607,547	1.57	5,572	3,549	9,254.7
Personal trucks^a	76,627.3	835,666	1,437,346	1.72	6,894	4,008	5,760.9

Intercity (Amtrak)	0.4	331	5,680	17.2	50,453	2,935	16.7
Transit (light & heavy)	12.2	694	15,082	21.7	70,173	3,228	48.7
Commuter	6.0	286	9,559	33.4	91,958	2,751	26.3

Source:

See Appendix A for Passenger Travel and Energy Use.

^a Changed significantly due to newly available data from the 2002 Vehicle Inventory and Use Survey. See Appendix A for details.

^b Includes passenger cars, vans, and small buses operating in response to calls from passengers to the transit operator who dispatches the vehicles.

^c Data are not available.

^d Energy use is estimated.

^e Includes domestic scheduled services and ½ of international scheduled services (Table 2.13 shows only domestic services). These energy intensities may be inflated because all energy use is attributed to passengers—cargo energy use is not taken into account.

See Appendix A for Highway Passenger Mode Energy Intensities.

^a All two-axle, four-tire trucks.

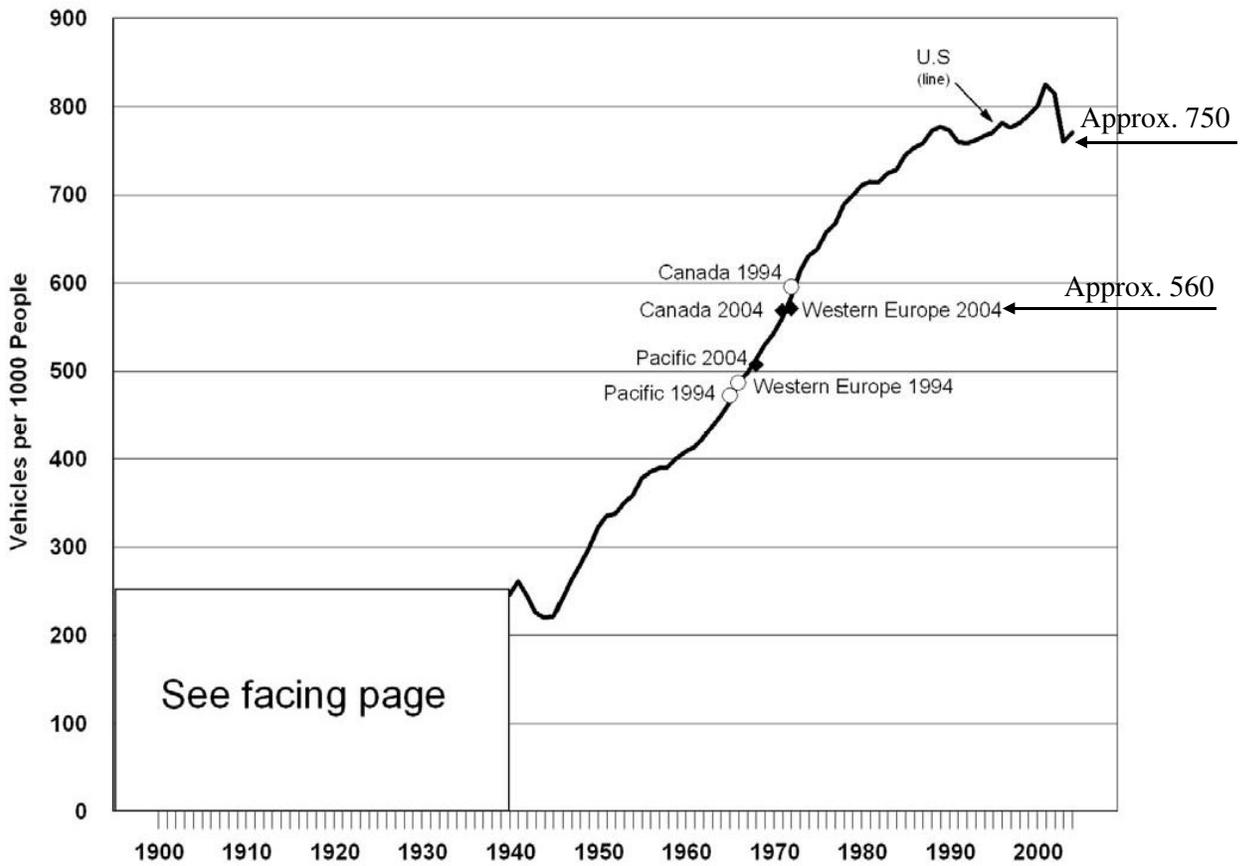

^b Series not continuous between 1983 and 1984 because of a change in data source by the American Public Transit Association (APTA).

^c 2001 data are not yet available.

The graphs below show the number of motor vehicles per thousand people for various countries. The data for the U.S. are displayed in the line which goes from 1900 to 2004. The points labeled on that line show data for the other countries/regions around the world and how their vehicles per thousand people compare to the U.S. at two different points in time, 1994 and 2004. For instance, the top graph shows that in 1994, Western Europe's vehicles per thousand people was about where the U.S. was in 1966, but by 2004 it is about where the U.S. was in 1972. The lower part of the graph (1900-1940) is shown enlarged on the facing page.

Figure 3.1. Vehicles per Thousand People: U.S. (Over Time) Compared to Other Countries (in 1994 and 2004)
